# Does Monitoring Make Food Safer?

Jason Huang

June 4, 2017

### Motivation

- Sanitation at retail food establishments is a great public health concern but is also difficult for average consumers to enforce or observe
- Municipal health departments conduct regular food inspections to ensure restaurants uphold hygiene standards
  - Dearth of empirical studies that measure the efficacy of inspections on restaurant compliance
- Major cities, such as New York City, have started to make food inspection results more transparent by having restaurants post grades

 Inspection results have become more prominent as they become integrated with Yelp

### Research Questions

- Do inspections incentivize restaurants to improve their sanitation practices?
  - Do restaurants shift attention and effort away from areas that they did well toward areas that got flagged?
  - How do the magnitudes of the results vary across different types of establishments (heterogenous effects)

# Main Findings

- Marginal increase in the number of citations leads to improved conditions in subsequent inspections
  - Instead of focusing only on areas that they got cited, restaurants seem to improve in other areas as well!
- More citations also reduces the probability that an establishment receives a complaint call

# Road Map

### Background

#### Data

Food Inspection Data 311 Call Data

### Impact of Inspections on Restaurant Behaviors

Inspector Specific Stringencies as Instrument
Impact of Violation Citations on Restaurant Cleanliness
Multi-Tasking
Robustness
Complaint Calls

#### Conclusion

# 2. Background on NYC Food Inspection Grading System

- Inspection occurs at least once a year
  - During inspection, inspector cites violations, assign scores based on severity, and sum up scores
- Total score is converted to letter grades based on the following cutoffs:
  - < 13: A
  - ≥ 14 and ≤ 27: B
  - > 28: C
- Dual Inspection: anything lower than A during initial inspection results in a second inspection within a month
  - In the meantime, post previous grade
- After each inspection, restaurants can pursue adjudication to argue for better grades (in the meantime, post "Grade Pending")
  - Resolved within 6 weeks of initial inspection
- The health department temporally closes a restaurant if it finds critical violations

### Food Inspection Data

- Universe of all food inspections conducted in NYC (2007 2016)
- Inspection date and inspector ID
- Individual violation codes, total score, corresponding adjudication date, and modified score
- Restaurant level info: name, address, cuisine, service type, and venue type

Jason Huang Health Inspection June 4, 2017 7 / 31

### 311 Call Data

- 311 is a phone line for non-emergency municipal services also carries complaint calls to Department of Health and Mental Hygiene concerning restaurants
  - Examples of complaints: 'Rodents/Insects/Garbage', 'Bare Hands in Contact w/ Food', 'Food Contains Foreign Object', 'Food Spoiled',
- From 2010 to present
- Each complaint has an incident address and date
- Use fuzzy string matching on street address to the inspection data

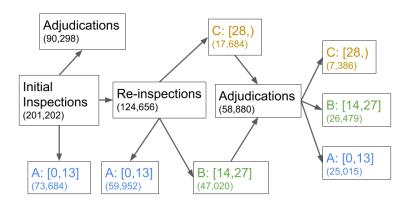

Jason Huang Health Inspection June 4, 2017 8 / 31

### Yelp Data

- Acquired start rating and review counts using public API
- Only the most recent data
- Successfully matched over 20,000 establishments

Jason Huang Health Inspection June 4, 2017 9 / 31

# NYC Food Inspection Pipeline

Jason HuangHealth InspectionJune 4, 201710 / 31

<sup>&</sup>lt;sup>0</sup>The numbers in the parenthesis are the number of inspections in those steps

# Impact of Inspection Results on Subsequent Inspection Scores

- Do inspection results affect sanitation?
  - Does getting a "bad" score make a restaurant work harder?
  - Does getting a "good" score cause a restaurant to slack off?
- Do the inspection results cause restaurants to reallocate efforts across multiple tasks?

Identification strategy: exploit the randomness of inspector assignment and use inspector stringencies as an instrument

Jason Huang Health Inspection June 4, 2017 11 / 31

### Outcomes of Interests from Subsequent Inspections

- Overall inspection scores
- Whether a restaurants receives an A and does not need an re-inspection
- Whether a restaurant commits critical violations that results in temporarily closure

Jason Huang Health Inspection June 4, 2017 12 / 31

# **Empirical Strategy**

$$Y_{i,t^{next}} = \beta Score_{i,t} + \delta_i + \tau_t + \tau_{t^{next}} + \varepsilon_{it}$$

- $Y_{i,t^{next}}$ : outcome from next inspection: overall score, temporary closure, getting an A
- t<sup>next</sup>: time period of next inspection
- Score<sub>i,tnext</sub>: inspection score from the next inspection
- $\tau_t$ : time fixed effect
- $\delta_i$ : restaurant fixed effect
- $\varepsilon_{it}$ : two-way clustered at zipcode and inspector levels<sup>1</sup>

<sup>&</sup>lt;sup>1</sup>(Cameron at el 2009)

# **Empirical Strategy**

### A challenge of OLS is that $SCORE_{it}$ is endogenous

- If  $\beta$  positive, places that do poorly in the past tend to do poorly in the future
  - Restaurant FE does not fix problem if we have persistence
- If  $\beta$  is negative, cannot rule out mechanical mean reversion.

Jason Huang Health Inspection June 4, 2017 14 / 31

### Use Inspector Assignment as Instrument

Instrument for when inspector j assigned to restaurant i

$$Z_{ij} = \frac{1}{n_j - I_{ij}} \left( \sum_{kjt \neq ijt} Y_{kjt} \right)$$

- $n_i$  total number of inspections done by inspector j
- $I_{ii}$  is the number of times inspector j has inspected restaurant i
- $Y_{kjt}$  is the outcome used to calculate inspector tendencies

Jason Huang Health Inspection June 4, 2017 15 / 31

# Inspector Stringency is Highly Predictive of Inspection Score

$$score_{it} = \gamma Z_{it} + \delta_i + \tau_t + \varepsilon_{it}$$

where  $Z_{it}$  is the leave-out propensity of inspector assigned to restaurant i in period t.

Robust standard errors in parentheses \*\*\* p<0.01. \*\* p<0.05. \* p<0.1

Jason Huang Health Inspection June 4, 2017 16 / 31

 $<sup>^{1}</sup>$ First column consists of all inspections after 10/1/2010. The sample for the second column is reduced to inspections with non-empty zipcode, chain indicator, cuising type, venue type, and service type. Standard errors are two-way clustered at the inspector and zipcode level.

# Graphical Representation of First Stage

Jason HuangHealth InspectionJune 4, 201717 / 31

### 5. Assignment Process of Inspectors to Restaurants

- DOHMH claims that each inspector is randomly assigned to each inspection
- Implies:

$$Z_{ijt} = \beta X_i + \delta L_{i,t-1} + \varepsilon,$$

with  $X_i$  as restaurant characteristics (cuisine, service type, venue type, chain, etc) and  $L_{i,t-1}$  as restaurant specific lag terms (previous scores and previous grades),  $\beta = \delta = 0$ .

Jason Huang Health Inspection June 4, 2017 18 / 31

### Multi-Dimensionality of Food Inspections

Individual Violation Codes Groped into Eight Groups:

Jason HuangHealth InspectionJune 4, 201721 / 31

### Multi-dimensional 1st Stage

Instrument Construction:

$$Z_{ijg} = \frac{1}{n_j - I_{ij}} \left( \sum_{kjgt \neq ijgt} \# Cited_{ijgt} \right)$$

1st Stage:

$$\#\mathit{Cited}_{\mathit{ijgt}} = \sum_{g' \in \mathcal{G}} \theta_{gg'} Z_{\mathit{ijg'}} + \varepsilon_{\mathit{ijgt}}$$

- #Cited<sub>iigt</sub> is the number of group g violation that inspector j finds in restaurant i at time t and  $\mathcal{G}$  is the set of violation groups
- $\theta_{gg'}$ : measures how inspector's propensity to find violation in group g'relates to one's probability of finding violation in group g

Jason Huang Health Inspection June 4, 2017 22 / 31

<sup>&</sup>lt;sup>1</sup>Standard errors are two-way clustered at zipcode and inspector levels

# Concerns of Empirical Strategy

#### Exclusion Restriction

- Inspectors adjust their grading, given the identities of the previous inspectors
  - Unlikely, given geographically dispersed and random assignment, inspectors need to mentally track the tendencies of hundreds of inspectors
- Inspectors affect restaurant outcomes through channels other than the inspections
- The causal channel of inspection results is through its influence on the subsequent inspectors' behaviors

#### Monotonicity condition

• The inspection score is strictly increasing in inspector stringency

Jason Huang Health Inspection June 4, 2017 26 / 31

# Monotonicity Tests

- Because inspections are multi-dimensional, monotonicity might not hold
  - Ex. A frozen yogurt establishment may get a better score from a more stringent inspector if that inspector cares only about hot food being kept above a certain temperature
- Two empirical implications:
  - Test 1: Stringent inspectors should be strict for different types of restaurants
    - Run first stage for various sub-samples (baseline sample)
  - Test 2: Inspectors who are strict for one type of restaurants should be strict for other types
    - Recalculate inspector stringency for each sub-sample with inspection results outside of that sub-sample (inverse-sample)

Jason Huang Health Inspection June 4, 2017 27 / 31

 $<sup>^{1}</sup>$ To reduce noise, only inspections conducted by inspectors who have done at least 50 inspections remain in the regressions.

Jason Huang Health Inspection June 4, 2017 28 / 31

### Sample Construction

- Convert from inspection level data to a restaurant-month level panel data
- When an inspection occurs in the middle of a month:
  - Consider only calls that were made in between the latest event and the end of the month
  - Calculate a weight variable as the fraction of days since the event to the end of the month

Jason Huang Health Inspection June 4, 2017 29 / 31

# Impact of Restaurant Score on Complaint Call Specification

• 2nd Stage

$$Pr(Called_{it}) = \delta_i + \tau_t + \beta_0 Score_{it} + \beta_1 Month\_Since\_Inspection_{it} + \beta_2 Month\_Since\_Inspection_{it} \times Score_i t + \varepsilon_{it}$$

- $\beta_3$  tests whether the effect of the inspection score changes across time
- Instrument Score<sub>it</sub> with inspector stringency

Jason Huang Health Inspection June 4, 2017 30 / 31

### Results

### Conclusion and Discussion

- Marginally more citations leads to improved subsequent inspection results
  - Restaurants improve the most in the areas in which they received citations
  - Some complementarity in cleanliness (ex. better refrigerator leads to few food temperature and food protection violations).
- Customers also perceive the improvement in sanitation by reducing complaint calls
  - $\bullet$  One standard deviation increase in inspection score decreases the probability of complaint call by 10%
